Occupational Risk Management

What is Occupational Risk Management?

Occupational Risk Management (ORM) was a vision of Ergonomic Technologies Corp. (ETC). It is a combination of disciplines necessary to increase productivity, enhance quality, and reduce the risk of injuries & fatalities in any working environment. A proactive approach to workplace risk factors, based on prevention, early recognition and change.

What are the goals of ORM?

1. Increased Productivity and enhanced Quality:

- Tasks are evaluated for the occupational hazard potential
- Placed in priority order for further evaluation
- Solutions developed
- Solutions are implemented

Implementing change for the reduction of hazards in **ESHE** will increase productivity:

- Workflow / Work processes / Work stations

All contributing to increases in Quality through employee satisfaction leading to performance at the highest potential without the fear of injury. By removing the risk factors waste & redo work are eliminated; the workplace is lean and more profitable. Companies will be able to readily see the cost benefit / ROI of instituting an ORM process and having it seamlessly fit into their corporate culture.

What are the disciplines included in ORM?

The disciplines included in ORM are:

- Ergonomics/Safety/Health/Environmental (**ESHE**)

2. **Reduction of fatalities and injuries:** By introducing the ORM concept of Prevention, companies will become regulatory compliant with all **ESHE** guidelines and rules worldwide. No more Reacting to workplace problems as ETC is introducing a Prevention modality to reduce and eliminate workplace hazards as well as the fear of any regulations. Workplaces become safer and more profitable. Companies can enjoy the feeling of greater prosperity and longevity as well as better labor relations.

3. **Employee health and well being:** increasing employee health and well being reduces the incidents of death, injuries, illnesses and the indirect costs of re-training and lost work time. By introducing the ORM model, management of any type of company displays a genuine concern for the welfare of the employees and their respective families.

Why develop an ORM Process?

- **ESHE** programs are being implemented throughout the world. They are performed without the benefit of combining Ergonomics into the process. Using the **ESHE** model will save time and money. All programs must have a return on investment and be able to cost justify their existence. ETC's **ESHE** provides prevention and a real return on investment.
- The ISO 18001 is driving awareness to the ORM model and will be adopted forcing companies to incorporate **ESHE** model. ETC will be the first company to offer a model that can be delivered in any type of working environment.
- **ESHE** provides specifications for the design of work methodologies, tools and equipment enhancing the user capabilities and recognize the limitations of the aging workforce. If not considered, production quality and human life will be at risk.

How can your company implement the ESHE Model?

ETC has contracted with individuals and companies all over the world that possess the core competencies necessary for **ESHE** application. These contractors are leaders in their respective fields and are recognized internationally. The services are:

- Corporate audits in **ESHE** risk assessments
- Solutions developed for all types of jobs
- Job descriptions leading to a "return to work" process
- Full report component including photographs
- Marketplace exchange for "off the shelf" products that serve as solutions and Personal Protection products for employees.

To compliment our professional staff, ETC also offers **ESHE Director®**, an artificially intelligent web based process that mimics the professional staff. Now the risk assessments and solutions are available on a web based process.
